No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                   1168

The invention relates to an isolated B7-like (B7-L) polypeptide (I). The polypeptide, polymucleotide encoding it and antibody against (I) are conditions including reproductive disorders (e.g. infertility, miscariage, preterm labour and delivery and endometriosis) and proliferative disorders. Antibodies, soluble proteins comprising extracellular domains and other regulators of B7-L polypeptides are useful for enhancing the immune response to tumours. (I) plays a role in growth and maintenance of cancer relate based on the observation of seminal vesicle hyperplasia in transgenic mice overexpressing B7-L cancer including seminal vesicle cancer, lung, brain, breast, ovarian, cancer including seminal vesicle cancer, lung, brain, breast, ovarian, cancer and cancers of haematopoietic system. B7-L polypeptide and paramaly vesicle cancer, lung, brain, breast, ovarian, cancer and cancers of haematopoietic system. B7-L polypeptide and paramaly vesicle cancer, lung, brain, breast, ovarian, testicular cancer and cancers of haematopoietic system. B7-L molecules are useful for alloquate transplantation, graft versus host disease, T-cell dependent B-cell mediated diseases and autoimmune diseases modernes and autoimmune diseases such as systemic immune cell dysfunction or to treat autoimmune diseases such as systemic for alleviating the symptoms associated with diseases such as systemic immune cell dysfunction or to treat autoimmune diseases such as systemic conternative colitis). Grave's disease, Hashimoto's thyroiditis and disease such as inflammatory bowel disease (Crohn's disease and disease such as inflammatory bowel disease. Hashimoto's thyroiditis and ciabetes mellitus. They are also useful as immunosuppressive agents for molecules are also useful for diagnosis and treatment of diseases involving abnormal cell proliferation, including arteriosclerosis and for treatment of allersy, asthme and penalty of the proving and penalty of the disposates and to prolong graft such and proprietation of toxic shock syndrome or prolong useful for diagnosing, preventing and treating reproductive, immune and proliferative disorders, e.g. cancer and arteriosclerosis. New B7-like polypeptides, polynucleotides and their modulators, 386 386 0 0 0 Chute HT; Length: Matches: Conservative: endocrinopathy; lymphoproliferative disorder. The invention relates to an isolated B7-like (B7-L) polypeptide (I). The polypeptide, polynucleotide encoding it and antibody against (I) are useful for treating B7-like polypeptide-related disease, disorders or conditions including reproductive disorders (e.g. infertility, miscarriage, preterm labour and delivery and endometriosis) and proliferative disorders. Antibodies, soluble proteins comprising extracellular domains and other regulators of B7-L polypeptides are useful for enhancing the immune response to tumours. (I) plays a role in growth and maintenance of cancer cells based on the observation of seminal vesicle hyperplasia in transgenic mice overexpressing B7-L polypeptide. Hence modulators of (I) account to the treatment of cancer including seminal vesicle (I) account to the treatment of cancer including seminal vesicle (I) account to polypeptide. Hence modulators of haematopoietic system. B7-L polypeptide pathway can be manipulated to regulate cyctoxic T-lymphocyte response in allograft transplantation, graft versus host disease, T-cell dependent B1-cell mediated diseases and autoimmune diseases. B7-L molecules are useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      331
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              GTCCTGAAGGGCTCCCAGGCTCGCTTCAACTGCACCGTCTCCCAGGGCTGGAAGCTCATC 151
diabetes mellitus. They are also useful as immunosuppressive agents for bone marrow and organ transplantation or to prolong graft survival. B7-L molecules are also useful for diagnosis and treatment of diseases involving abnormal cell proliferation, including arteriosclerosis and vascular restenosis. Antagonists of B7-L polypeptides are useful for alleviation of toxic shock syndrome or allosensitisation due to blood transfusions, and for treatment of allerya sthma and hypersensitivity reactions, nephropathies (e.g. glomerulonephritis), skin disorders (pemphigus and pemphigoid), endorinopathies (Grave's disease), various pneumopathies (extrinsic alveolitis), vasculopathies, coeliac disease, anaemia, thrombocytopenias, Guillain-Barre syndrome and myasthenia gravis, and lymphoproliferative disorders such as multiple myeloma. The present sequence represents the amino acid sequence of human B7-L_hl

proliferative disorders. Antibodies, soluble proteins comprising extracellular domains and other regulators of B7-L polypeptides are useful for enhancing the immune response to tumours. (I) plays a role in growth and maintenance of cancer cells based on the observation of seminal vesicle hyperplasia in transgenic mice overxypressing B7-L polypeptide. Hence medulators of (I) are useful for the treatment of cancer including seminal vesicle cancer, lung, brain, breast, ovarian, testicular cancer and cancers of haematopoietic system. B7-L polypeptide pathway can be manipulated to regulate cytotoxic T-lymphocyte response in allograft transplantation, graft versus host disease, T-cell dependent B-cell mediated diseases and autoimmune diseases. B7-L molecules are useful for alleviating the symptoms associated with diseases involving chronic immune cell dysfunction or to treat autoimmune diseases involving chronic immune thrombocytopenic purpura and psoriasis, chronic inflammatory disease such as inflammatory bowel disease (Crobn's disease and claeses thrombocytopenic purpura and psoriasis, chronic inflammatory disease such as inflammatory bowel disease (Crobn's disease and claese transplantation or to prolong graft survival. B7-L concerned and organ transplantation or to prolong graft survival. B7-L molecules are also useful for diagnosis and treatment of diseases involving abnormal cell proliferation, including arteriosclerosis and vascular restenosis. Antagonists of B7-L polypeptides are useful for the continuor of toxic syndrome or allosensitisation due to blood (pemphigus and pemphigoid), endocrinopathies (Grave's disease), various pneumopathies (extrinsic alveolitis), vasculopathies, coeliac disease, anaemia, thrombocytopenias, Guillain-Barre syndrome and myasthenia gravis, and lymphoproliferative disorders such as multiple myeloma. The present sequence represents the amino acid sequence of human B7-L h3 transfusions, and for treatment of allergy, asthma and hypersensitivity reactions, nephropathies (e.g. glomerulonephritis), skin disorders (pemphigus and pemphigoid), endocrinopathies (Grave's disease), various \$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$

```
to the polymental defined in a polyments and many defined or peptide or its partial peptide, an antibody binding to the polymetride or peptide or its partial peptide, an antibody binding to the polymetride or peptide or the polymetride of immunologically assaying the polymetride or peptide or peptide of the polymetricetide by contacting the polymetride or peptide or peptide of the polymetride by contacting the polymetride or peptide or peptide of the polymetrial peptide or peptide or with the antibody of the encoded protein, and observing the binding between the two, a transformant carrying the polymetricetide. The oligonucleotide in an expressible manner and an antisense polymetricetide. The oligonucleotide for detecting the polymetricetide. The polymetricetide, or as a probe or or superior are useful as pharmaceutical agents and many disease-related proteins are useful as pharmaceutical agents and many disease-related conference therapy. The genes are involved in tissue and/or cell creameration. Membrane proteins, signal transduction-related proteins, contacting them can be used as indicators for diseases (e.g. osteoporosis, concortiuty or expression of the encoded proteins and genes or encoding them can be used as indicators for diseases (e.g. osteoporosis, cancer, tumours. The cDNA may be used to regulate the activity or expression of the encoded protein to treat diseases. The sequence data for this patent is not represented in the printed sequence data for this patent is not represented in the printed sequence data for this patent is not represented in the printed security.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               129
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                149
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             169
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      511

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated B7-like (B7-L) polypeptide (I). The polypeptide, polynucleotide encoding it and antibody against (I) are useful for treating B7-like polypeptide-related disease, disorders or conditions including reproductive disorders (e.g. infertility, miscarriage, preterm labour and delivery and endometriosis) and proliferative disorders. Antibodies, soluble proteins comprising extracellular domains and other regulators of B7-L polypeptides are

cc useful for enhancing the immune response to tumours. (I) plays a role in growth and maintenance of cancer cells based on the observation of seminal vesicle hyperplasia in transgenic mice overexpressing B7-L polypeptide.

Cc polypeptide. Hence modulators of (I) are useful for the treatment of cancer including seminal vesicle cancer, lung, brain, breast, ovarian, testicular cancer and cancers of haematopoietic system. B7-L polypeptide cancer including seminal vesicle cancer, lung, brain, breast, ovarian, cersticular cancer and cancers of haematopoietic system. B7-L polypeptide cancer including seminal vesicle cancer, lung, brain, breast, ovarian, cc languate transplantation, graft versus host disease, T-cell dependent B-cc allograft transplantation, graft versus host diseases und sesymptoms associated with diseases und as systemic for alleviating the symptoms associated with diseases such as systemic coll meantosus, theumatosus, theumatosus, theumatosus, theumatosus, theumatosus, theumatosus, theumatosus, theomatosus, disease and clasease such as inflammatory bowel disease (Crohn's disease and clasease such as inflammatory bowel disease, Hashimoto's thyroiditis and claseases mellitus. They are also useful as immunosuppressive agents for bone marrow and organ transplantation or to prolong graft survival. B7-L molecules are also useful for diagnosis and traatment of diseases classical collections, nephropathies (e.g. glomerulonephritis) and hypersensitivity reactions, nephropathies (e.g. glomerulonephritis) and hypersensitivity creactions, nephropathies (e.g. glomerulonephritis), vasculopathies, cellacia disease, canaemia, thrombocytopenias, Guillain-Barre syndrome and myasthenia.

Cc present sequence represents the amino acid sequence of human B7-L h4

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PRS) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this electronic format directly from MPO at an electronic format directly from MPO at the printed specification, but was obtained in electronic format directly from MPO at the printed specification, but was obtained in electronic format directly from MPO at

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foctal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pct_sequences
by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical and and order. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; foetal liver; gene expression; single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide #9548 encoded by human foetal liver single exon probe.

Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human placenta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                      Peptide #9881 encoded by probe for measuring placental gene expression.

measuring human gene expression in a sample derived from human heart (see ABA21535-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pct_sequences
                                                                                                                                                           Protein #7653 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Single exon nucleic acid probes for analyzing gene expression in human

They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilopsy, and cancers. The present sequence is a protein encoded by one of
Human; brain expressed exon; gene expression analysis; probe; microarray;
Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; liver; cirrhosis; hyperlipoproteinaemia; hyperlipidaemia; hypercholesterolaemia; coronary heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 4; SEQ ID NO 35028; 650pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               78

The invention relates to a single exon nucleic acid probe (SENP) (1) for measuring human gene expression in a sample derived from human adult liver. Comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. It may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABC47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                           Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 27; SEQ ID NO 36121; 658pp; English.

Penn SG, Hanzel DK,

Spatially-addressable set of single exon nucleic acid probes, used to measure gene expression in human lung samples.

Claim 27; SEQ ID NO 34884; 634pp; English.

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 1287 open reading frames derived from the 12614 to probes Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample of expressed in the human lung; measuring gene expression in a sample of collection of detectably labeled nucleic acids derived from human lung mRNA, and (b) measuring the label detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising (a) array; identifying exons in a eukaryotic genome, comprising (a) extray; identifying exons in eukaryotic genome, comprising (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, comprising (a) identifying exons from genomic sequence by the method in the above mentioned microarray; assigning exons to a single exon probe, comprising (a) identifying exons from genomic sequence by the method tissues and/or cell types using hybridisation to a single exon in the exons should be assigned to a single gene; a peptide comprising of expression of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single gene; a peptide comprising of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single gene; a peptide comprising of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single gene; a peptide comprising of the exons common pattern of the exons should be assigned to a single exon probe wit cancer, chronic obstructive pulmonary disease (COPD), interstitial lung diseases (LID), familial didopathic pulmonary fibrosis, neurofibromatosis, tuberous sclerosis, Gaucher's disease, (Memann-Pick disease, Hermansky-Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary histocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis, karagener syndrome, fibrocystic pulmonary dysplasis, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention. Note: The sequence data for this patent did not form part directly from WIPO at ftp.wipo.int/pub/published_pot_sequences

The invention relates to novel isolated human G protein-coupled receptors (nGPCR-x). The nGPCR-x can be used for screening compounds which can be used to treat mental disorders, thyroid disease, renal failure, inflammatory conditions such as Crohn's disease, rhematoid arthritis, autoimmune disorders schizophrenia, migraine, stroke, dementia, disease. They may also be used for treating viral infections such as human immunodeficiency virus (HIV), type 2 diabetes, obseity, anorexia, hypotensiano, hypotensian, thrombosis, myocardial infarction, atherosclerosis, cancer, and sexual dysfunction. AAUZ5617-AAUZ5726 represent the amino acid sequences of novel human G protein-coupled
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nGPCR-x, used to screen for compounds for disorders, such as Alzheimer's disease, or

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS737-ABH72072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

frameshift mutation in a gene from a cancer cell. The peptides are frameshift mutation in a gene from a cancer cell. The peptides are frameshift mutation in a gene from a cancer cell. The peptides are characterised in that they: (i) are at least 8 amino acids long and a fragment of a mutant protein arising from a frameshift mutation in a gene of a cancer cell; (ii) consist of at least one amino acid of the mutant part of the protein sequence encoded by the gene; (iii) comprise 0-10 amino acid from the carboxyl terminus of the mutant sequence and may further extend to the carboxyl terminus of the mutant sequence and may further extend to the carboxyl terminus of the mutant part of the protein sequence preceding the amino terminus of the mutant sequence and may further extend to the carboxyl terminus of the mutant the protein and (iv) induce, either in their full lengths or after processing by an antigen presenting cell (APC), T cell responses. The genes that the peptides are derived from, are characterised as susceptible to frameshift mutation by having a mono nucleoside base repeat sequence of at least 5 ceidues, or a di-uncleoside base repeat sequence of at least 5 ceidues, or a di-uncleoside base respeat sequence of at least 5 ceidues or a di-uncleoside base respeat sequence of at least 5 ceidues can elicit T cell responses and toxicity against tumours and cancer cells carrying genes with frameshift mutations. The novel peptides and DNA sequences can be used for the preparation of a comment of a com composition for the treatment or prophylaxis of cancer

frameshift mutation in a gene from a cancer cell. The peptides are frameshift mutation in a gene from a cancer cell. The peptides are characterised in that they: (i,) are at least 8 amino acids long and a fragment of a mutant protein arising from a frameshift mutation in a gene of a cancer cell; (ii) consist of at least one amino acid of the mutant part of a protein sequence encoded by the gene; (iii) comprise 0-10 amino acid from the carboxyl terminus of the mutant part of the protein sequence preceding the amino terminus of the mutant part of the protein card dermined by a new stop codon generated by the frameshift mutation; and (iv) induce, either in their full lengths or after processing by an antigen presenting cell (APC), T cell responses. The genes that the peptides are derived from, are characterised as susceptible to frameshift mutation by having a mono nucleoside base repeat sequence of at least 5 mutation by having a mono nucleoside base repeat sequence of at least 5 residues, or a di-nucleoside base repeat sequence of at least 4 di-nucleoside base units. The peptides are created by the addition or deletion of 1 or 2 nucleoside base residues from the repeat sequence. The novel peptides can elicit T cell responses and toxicity against tumours and cancer cells carrying genes with frameshift mutations. The novel peptides and DNA sequences can be used for the preparation of a composition for the treatment or prophylaxis of cancer.

mutein.

```
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

The genes that the peptides are derived from, are characterised as susceptible to frameshift mutation by having a mono nucleoside base repeat sequence of at least 5 cresidues, or a di-nucleoside base repeat sequence of at least 5 cresidues, or a di-nucleoside base residues from the repeat sequence. The nucleoside base units. The peptides are created by the addition or caption of 1 or 2 nucleoside base residues from the repeat sequence. The novel peptides can elicit T cell responses and toxicity against tumours and cancer cells carrying genes with frameshiff mutations. The novel peptides and No sequence of the the preparation of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), processed DNA sequences (ABL16176-ABL30511). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175 and the encoded proteins (ABB57737-ABB572072). The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

New polynucleotide comprising a plant nucleotide sequence having an open reading frame that encodes a polypeptide associated with disease resistance, useful for conferring resistance or tolerance to a plant
                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                      New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    disease resistance; pathogen tolerance; plant pathogen; plant; rice.
                                                                                                                                 ID NO 28224; 21pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elunidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL10176-ABL30511), expressed DNA sequences (ABL10140-ABL16175) and the encoded proteins (ABBS7137-ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                             New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              developmental biology; cell signalling; insecticide;

The invention relates to a novel isolated polynucleotide comprising a plant nucleotide sequence having an open reading frame that encodes a polypeptide associated with disease resistance or its fragment having substantially the same activity as the full-length polypeptide. The polynucleotide of the invention is useful for conferring resistance or tolerance to a plant pathogen. The present sequence represents a protein conferring disease resistance used in the invention.

screening New antisense nucleic acids, useful for identifying proteins or scre for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

Claim 25; SEQ ID NO 45161; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense

```
The indicate actus, (4) and sold cell containing the vectors, (3) an isolated anticense nucleic acid, (4) an antibody capable of specifically binding antisense nucleic acid, (4) an antibody capable of specifically binding continuous propagation, (5) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene in an operon required for proliferation, or that has an activity against a biological pathway or equired for proliferation, or that inhibits cellular proliferation, (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene or which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the collection of an organism. The antisense nucleic acids required for cellular proliferation to isolate candidate molecules for rational correquired for proliferation in cells other than S. aureus, S. typhimmrium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target processes, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimmrium, C. the target processes, or fit be printed specification, but was obtained correct format directly from WiPO at C. the wiPo.int/pub/published_pot_sequences
(2) a host cell containing the vector; (3) an isolated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 258 AA;

from Actinomycetes sp. BTG catalyses an acyl rearrangement reaction of a gamma-Carboxyamide gp. of glutamine. It introduces intra- or intermolecular formation of epsilon-(gamma-Gln)-Lys cross-linking when an epsilon-amino gp. of a Lys residue acts as an acyl receptor. When water acts as an acyl acceptor the enzyme accelerates the conversion of Gln residues to Glu residues by deamination. The enzyme is used in the prodn. of gelled foods, gelled cosmetics, yogutt, gelatin, cheese etc. It is also used in the prodn. of thermally stable materials such as microcapsules and carriers of immobilized enzymes. The DNA sequence given allows the prodn. of BTG efficiently and in large quantity. (Updated on 25-MAR-2003 to correct PA field.)

New Acinetobacter baumanii proteins and nucleic acids, useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or as biocontrol agents for
                                                                                                                                                                        The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.

Bacterial transglutaminase polypeptides useful for polymerizing proteins, e.g. to modify the properties of food, pharmaceutical or cosmetic products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel bacterial transglutaminase polypeptide.

(I) can be used, e.g. in the food, pharmaceutical and cosmetic industries, to polymerize proteinaceous materials in order to improve their properties, e.g. texture, gel strength, breaking strength, viscosity, elasticity or taste (I) can also be used to immobilize enzymes and antibodies. This sequence represents a transglutaminase isolated from Streptoverticillium S-8112. (Updated on 17-OCT-2003 to

The present sequence represents a transglutaminase of Streptoverticillium sp. . The specification describes a new microbial transglutaminase that has the N-terminal separatic acid of the present transglutaminase deleted. Bliminating the N-terminal Asp from microbial transglutaminase allows efficient removal of the terminal Methionine residue added when the protein is expressed in Escherichia coli. The E. coli methionine aminopeptidase acts well on Met-Ser but only poorly on Met-Asp, so problems of antigenicity associated with Met-terminated proteins are avoided. Recombinant transglutaminase is used to produce gelled foods meat, in the production of materials for microcapsules of high thermal stands and as a carrier for immobilised enzymes. The present invention describes a method for designing and constructing a variant transglutaminase by estimating the binding site of Streptoverticillium mobaraense-oxiginated transglutaminase (WTG) to the substrate based on the stereo-structure obtained by X-ray analysis of the crystalline structure of WTG orystals, and e.g. substituting amino acid residues located at the substrate-binding site of the transglutaminase. The method can be used for designing and constructing a variant transglutaminase. The obtained transglutaminases can be used in food processing. The modified transglutaminases have improved transglutaminase activity and thermal stability, substrate-specificity and an less activity and thermal stability, substrate-specificity and an less isolated from Streptoverticillium mobaraense (also called Streptomyces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Designing and constructing a variant of Streptoverticillium mobaraense-originated transglutaminase (MTG), for use in food processing, comprises estimating the binding site of MTG based on its stereo-structure.
                                                                                                                        Microbial, transglutaminase; protein co-ordinate data; stereo-structure; X-ray analysis; crystalline structure; enzyme; food processing; thermal stability.
                                                                                       Streptoverticillium mobaraense transglutaminase protein SEQ ID NO:2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a process for the production of a foreign secretory protein through the construction of a recombinant coryneform bacterium. The coryneform bacterium is transformed with an expression construct in which DNA encoding a target foreign protein pro-structure is ligated to the downstream region of DNA encoding the signal peptide the vector, the bacterial protein. Following transformation with the vector, the bacterium is cultured, and the pro-peptide cleaved from the expressed protein. Transglutaminases produced using this process are useful in the food processing and pharmacoutical industries. The present sequence represents a transglutaminase related protein, which can be used in the method of the invention. (Updated on 11-SEP-2003 to standardise OS

The present sequence is encoded by the high expression transglutaminase gene present in plasmid pTRPMTG-02. The gene is derived from Streptoverticillium Sp., and is codon altered, using oligonucleotides AAV81521-60, for expression in Escherichia coli. The specification describes a new microbial transglutaminase that has the N-terminal Asparatic acid of transglutaminase deleted. Bliminating the N-terminal Asparamicrobial transglutaminase allows efficient removal of the terminal Met residue added when the protein is expressed in E. coli. The E. coli methionine aminopetidase acts well on Met-Ser but only poorly on Met-
                                                                                                                                                                                                                                                                                                                                                                                                                                       New microbial transglutaminase with N-terminal aspartic acid deleted - allowing high level recombinant production without added methionine in E. coli, useful in production of gelled foods, cosmetics etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Asp, so problems of antigenicity associated with Met-terminated proteins are avoided. Recombinant transplutaminase is used to produce gelled foods (jellies, yogurt and cheeses) or cosmetics, to improve the quality of meat, in the production of materials for microcapsules of high thermal stability and as a carrier for immobilised enzymes

The present invention describes a method for producing active transglutaminase from denatured enzyme. The method comprises: (i) forming an intermediate structure of the enzyme having transglutaminase activity under acidic conditions in an aqueous medium; and (ii) forming a higherneutral conditions in an aqueous medium; the method can be used for industrial production of active transglutaminase from denatured material is secombinant transglutaminase) which can be used in the food industry for the production of gelled foods such as jellies, yoghurts and cheeses, and for the production of gelled cosmetics. The present sequence represents a transglutaminase which is used in the exemplification from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Microbial, transglutaminase, protein co-ordinate data; stereo-structure, X-ray analysis, crystalline structure, enzyme, food processing; thermal stability.

                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for designing and constructing a variant transglutaminase by estimating the binding site of Streptoverticillium mobaraense-originated transglutaminase (MTG) to the substrate based on the stereo-structure obtained by X-ray analysis of the crystalline structure of MTG crystals, and e.g. substituting amino acid residues located at the substrate-binding site of the transglutaminase. The method can be used for designing and constructing a variant transglutaminase. The obtained transglutaminases can be used in food processing. The modified transglutaminases have improved transglutaminase activity and thermal stability, substrate-specificity and an less required optimum ph. The present sequence represents a transglutaminase isolated from Streptoverticillium mobaraense (also called Streptomyces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polyvalent antigen; pAg; antigen; Ag; crosslinking; biological agent; virucide; antibacterial; fungicide; antiparastic; cytostatic; nootropic; neuroporotective; vaccine; immunogenic; antigenic; midigenic; mifection; cancer; Alzheimer's disease; immune-related disease; autoimmune disease; Streptomyces mobaraensis; transglutaminase; EC 2.3.2.13; enzyme.
                                                                                                                                                                                                                                                                                                                                                Designing and constructing a variant of Streptoverticillium mobaraense-originated transglutaminase (MTG), for use in food processing, comprises estimating the binding site of MTG based on its stereo-structure.

The present invention describes a method for producing a polyvalent antigen (pag). The method comprises: (i) treating an antigen (Ag) in a crosslinking solution with a biological agent (I); and (ii) incubating so that Ag is converted to crosslinked agent (I); and (ii) incubating so converted to crosslinked products. The pag has virucide, antibacterial, fungicide, antiparasitic, cytostatic, nootropic and neuroprotective activities, and can bused in vaccines. The method is useful in preparing immunogenic compositions, using disease-specific compounds optionally modified to include a (I)-reactive amino acid that are combined in crosslinking solution then treated with (II), that can be useful in human and veterinary medicine, particularly as vaccines, for treatment and prevention of infections (viral, bacterial, fungal or parasitic), cancers and Alzheimer's disease, also of immune-related or autoimmune diseases. Antibodies against pag are useful as diagnostic caucoimmune diseases. Antibodies against pag are useful as diagnostic food or leather processing, in cosmetics and as enzyme carriers. The food or leather processing, in cosmetics and as enzyme carriers. The present sequence representes a Streptomyces mobaraensis transglutaminase (EC 2.3.2.13), which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Preparation of polyvalent antigen, useful in vaccines, comprises crosslinking antigen in presence of biological agent, especially transglutaminase, and derived antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       33

Expression of DNA encoding this protein in E. coli allow large scale prodn. of BTG. An active BTG can be prepd. from the inactive fused protein inclusion body. (Updated on 10-MAR-2003 to add missing OS field.)

The present invention describes a method for producing a polyvalent antigen (pAg). The method comprises: (i) treating an antigen (Ag) in a crosslinking solution with a biological agent (I), and (ii) incubating so that Ag is converted to crosslinked products. The pAg has virucide, antibacterial, fungicide, antiparasitic, cytostatic, nootropic and neuroprotective activities, and can be used in vaccines. The method is useful in preparing immunogenic compositions, using disease-specific compounds optionally modified to include a (I)-reactive amino acid that are combined in crosslinking solution then treated with (I), that can be used as vaccines. PAg, and other related antigenic compositions, are useful in human and veterinary medicine, particularly as vaccines, for treatment and prevention of infections (viral, bacterial, fungal or parasitic), cancers and Alzheimer's disease, also of immune-related or autoimmune diseases. Antibodies against pAg are useful as diagnostic or cancers and Antibodies against the are useful as diagnostic or cancers and Antibodies against the area useful as diagnostic or cancers and Antibodies against the area useful as diagnostic or cancers and Antibodies against the area useful as diagnostic or cancers and Antibodies against the area useful as diagnostic or cancers and accounted are useful.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              reagents and crosslinked proteins can also be useful as diagnostic food or leather processing, in cosmetics and as enzyme carriers. The present sequence represents a Streptomyces mobaraensis recombinant 6X-His example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Preparation of polyvalent antigen, useful in vaccines, comprises crosslinking antigen in presence of biological agent, especially transglutaminase, and derived antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length:

(I) is useful as hybridisation probes, polymerase chain reaction (PCR) primeras, ollgomers, and for chomosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed sequence tags for identifying expressed sequence tags for identifying expressed cerivity of (II) as useful in gene therapy techniques to restore normal cerivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in issue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polyputolectide sequences have applications in diagnostics, formsics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic and not amino acid sequences of the invention. Note: The sequence other this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    parent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.

different species, Streptoverticillium and Actinomycetes. It catalyses an acyl rearrangement reaction of a gamma-carboxyamide gp. of glutamine. It introduces intra- or interamolecular formation of epsilon-(gamma-GIN)-lys cross-linking when an epsilon-amino gp. of a Lys residue acts as an acyl receptor. When water acts as an acyl acceptor the enzyme accelerates the conversion of Gln residues to Glu residues by deamination. The enzyme is used in the prodn. of gelled foods, gelled cosmetics, yogurt, gelatin, chese etc. It is also used in the prodn. of thermally stable materials such as microcapsules and carriers of immobilized enzymes. The DNA sequence given allows the prodn. of BTG efficiently and in large quantity. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 27-AUG-2003 to correct PA field.)
The mature transglutaminase enzyme (BTG) can be derived from two

The present invention describes a Streptomyces sp. containing a gene construct comprising actinomycete-derived transglutaminase gene and promoter. Also described are methods for producing pro-transglutaminase and active transglutaminase. The gene construct can be used in the production of large amounts of transglutaminase. The present sequence represents Streptoverticillium mobaraense IPO 13819 transglutaminase, which is given in the exemplification of the present invention. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Streptomyces sp. carrying an actinomycete-derived gene and promoter for producing high yields of transglutaminase.
                                                                                                                                      Streptoverticillium cinnamoneum IFO 12852; Streptomyces; actinomycete; Streptoverticillium mobaraense IFO 13819; transglutaminase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score:
NAME OF COLORS OF STATE OF STA
```

```
This invention relates to a process for the production of a foreign secretory protein through the construction of a recombinant coryneform bacterium is transformed with an expression construct in which DNA encoding a target foreign protein pro-structure is ligated to the downstream region of DNA encoding the signal peptide domain of a coryneform bacterial protein. Following transformation with the vector, the bacterium is cultured, and the pro-peptide cleaved from the expressed protein. Transglutaminases produced using this process are useful in the food processing and pharmaceutical industries. The present illustrating the method of the invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                               Efficient secretory production of foreign proteins e.g. transglutaminase employing transformant coryneform bacterium, simply on industrial scale with direct recovery for use in food processing and pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Coryneform bacterium; signal peptide domain; food processing; medicine; cosmetic; transglutaminase; human epithelial growth factor.

- by expression of

Prepn. of bacterial trans-glutaminase in large amts. - fusion protein in E. coli bacterial trans-glutaminase.

Disclosure, Page 8-10; 13pp; Japanese.

Ö

hydrophilic peptide at the amino terminal. Expression of DNA encoding this protein in E. coli allow large scale prodn. of BTG. An active BTG can be prepd. from the inactive fused protein inclusion body. (Updated 10-MAR-2003 to add missing OS field.) protein contains amino acids 16-346 of BTG (AAQ55983) and

Sequence 408 AA;

The invention relates to a method for producing a foreign protein by culturing a mutant strain of a coryneform bacterium that contains an expression gene construct to secrete the foreign protein, followed by recovery of the produced foreign protein. The gene construct is obtained by ligation of a nucleic acid encoding a signal peptide domain originating from a coryneform bacterium, to downstream of a functioning promoter sequence in the coryneform bacterium and also by ligation of a nucleic acid encoding a foreign protein, to downstream of a nucleic acid sequence encoding the signal peptide. The method is useful for the production of a foreign protein, to applicable in producing e.g. industrially-useful transglutaminase and human epithelial growth factor for use in medicine, cosmetics and food processing. This sequence
                                                                                                                                                                                                                                                  Secretion production of foreign proteins by culturing transformant corymeform bacteria, applicable in producing e.g. industrially-useful transglutaminase and human epithelial growth factor.

The invention relates to an isolated B7-like (B7-L) polypeptide (I). The polypeptide, polymucleotide encoding it and antibody against (I) are polypeptide, polymucleotide encoding it and antibody against (I) are useful for treating B7-like polypeptide-related disease, disorders or conditions including reproductive disorders (e.g. infertility, miscarriage, preterm labour and delivery and endometriosis) and extracellular domains and other regulators of B7-L polypeptides are useful for enhancing the immune response to tumours. (I) plays a role in crowth and maintenance of cancer cells based on the observation of growth and maintenance of cancer cells based on the observation of cancer including seminal vesicle cancer, lung, brain, breast, ovarian, cesticular cancer and cancers of haematopoietic system B7-L polypeptide plays are considered diseases and autoimmune diseases. T-cell dependent B-cell mediated diseases and autoimmune diseases. T-cell dependent B-cell mediated diseases and autoimmune diseases involving chronic immune cell dysfunction or to treat autoimmune diseases unch as systemic immune chromboorytopenic purpura and positias, chronic inflammatory cisease such as inflammatory bowel disease (Crohn's disease and cromer of disease mellitus. They are also useful as immunosuppressive agents for hone marrow and ornan trangularial also mennolong graft survival B7-L bone marrow and organ transplantation or to prolong graft survival. B7-L molecules are also useful for diagnosis and treatment of diseases unvolving abnormal cell proliferation, including arteriosclerosis and vascular restenosis. Antagonists of B7-L polypeptides are useful for alleviation of toxic shock syndrome or allosensitisation due to blood transfusions, and for treatment of allergy, asthma and hypersensitivity reactions, nephropathies (e.g. glomerulonephritis), skin disorders (pemphigus and pemphigoid), endocrinopathies (Grave's disease), various pneumopathies (extrinsic alveolitis), vasculopathies, coeliac disease, anaemia, thrombocytopenias, Guillain-Barre syndrome and myasthenia gravis, and lymphoproliferative disorders such as multiple myeloma. The present sequence represents the amino acid sequence of human B7-L hi for diagnosing, preventing and treating reproductive, immune and proliferative disorders, e.g. cancer and arteriosclerosis. New B7-like polypeptides, polynucleotides and their modulators, 385 0000 0000 Chute HT; Matches: Conservative: Mismatches: endocrinopathy; lymphoproliferative disorder. The invention relates to an isolated B7-like (B7-L) polypeptide (I). The polypeptide, polymucleotide encoding it and antibody against (I) are useful for treating B7-like polypeptide—related disease, disorders or conditions including reproductive disorders (e.g. infertility, miscarriage, preterm labour and delivery and endometriosis) and conditions including reproductive disorders. Antibodies, soluble proteins comprising extracellular domains and other regulators of B7-L polypeptides are extracellular domains and other regulators of B7-L polypeptides are useful for enhancing the immune reals based on the observation of seminal vesicle hyperplasia in transgenic mice overexpressing B7-L polypeptide. Hence modulators of (I) are useful for the treatment of seminal vesicle hyperplasia in transgenic mice overexpressing B7-L polypeptide. Hence modulators of (I) are useful for the treatment of cancer including seminal vesicle cancer, lung, brain, breast, ovarian, testicular cancer and cancers of hematopoletic system. B7-L polypeptide cancer including seminal vesicle cancer, lung, brain, breast, ovarian, testicular cancer and cancers of hematopoletic system. B7-L polypeptide call mediated diseases and autoimmune diseases. B7-L molecules are useful call modiated diseases and autoimmune diseases. B7-L molecules are useful cortal alleviating the symptoms associated with diseases such as systemic immune cell dysfunction or to treat autoimmune diseases involving chronic inflammatory cimmune thrombocytopenic purpura and psoriasis, chronic inflammatory cimmune thrombocytopenic purpura and psoriasis, chronic inflammatory disease such as inflammatory bowel disease (Crohn, s disease and ulcerative colitis), Grave's disease (Crohn, s disease and

bone marrow and organ transplantation or to prolong graft survival. B7-L molecules are also useful for diagnosis and treatment of diseases involving abnormal cell proliferation, including arteriosclerosis and vascular restenosis. Antagonists of B7-L polypeptides are useful for alleviation of toxic shock syndrome or allosensitisation due to blood transfusions, and for treatment of allergy, asthma and hypersensitivity reactions, nephropathies (e.g. glomerulonephritis), skin disorders (pemphigus and pemphigoid), endorinopathies (Grave's disease), various pneumopathies (extrinsic alveolitis), vasculopathies, coeliac disease, anaemia, thrombocytopenias, Guillain-Barres syndrome and myasthenia gravis, and lymphoproliferative disorders such as multiple myeloma. The present sequence represents the amino acid sequence of human B7-L-H3 are also useful as immunosuppressive agents for They

The invention discloses a polynucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel polypeptides. Also claimed is a polypeptide encoded by the polynucleotide or its partial peptide, an antibody binding to the polypeptide or peptide of the polynucleotide, immunologically assaying the polypeptide or peptide peptide of the polynucleotide by contacting the polypeptide or peptide with the antibody of the encoded protein, and observing the binding between the two, a transformant carrying the polynucleotide in an expressible manner and an antisense polynucleotide. The oligonucleotide is useful as a primer for synthesising the polynucleotide, or as a probe for detecting the polynucleotide. The polynucleotide in encoded groteins are useful as pharmaceutical agents and many disease-related genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             273
                                       encoding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tumours. The cDNA may be used to regulate the activity or expression of the encoded protein to treat diseases. The sequence presented is a protein of the invention. Note: Some of the sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the
                                                                                                                                                                                                                                                                                                                                                                                                        73
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 93
                                                                                                                                                                                                                                                                                                                                                    53
of gene therapy. The genes are involved in tissue and/or cell regeneration. Membrane proteins, signal transduction-related proteins, transcription-related proteins, disease-related proteins and genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SerAspLeuGlnSerAlaValSer1leLeuAlaLeuThrProGlnSerAsnGlyThrLeu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 LeuProSerLeuGlyPheSerLeuProThrTrpGlyLysValGlyLeuGlyLeuAlaGly

The invention relates to an isolated B7-like (B7-L) polypeptide (I). The polypeptide, polynucleotide encoding it and antibody against (I) are polypeptide, polynucleotide encoding it and antibody against (I) are conditions including reproductive disorders (e.g. infertility, miscarriage, preterm labour and delivery and endometriosis) and proliferative disorders. Antibodies, soluble proteins comprising proliferative dimension and other regulators of B7-L polypeptides are useful for enhancing the immune response to tumours. (I) plays a role in growth and maintenance of cancer cells based on the observation of growth and maintenance of cancer cells based on the observation of cancer including seminal vesicle ancer, lung, brain, breast, ovarian, testicular cancer and cancers of haematopoietic system. B7-L polypeptide perhaps of C3 are seticular cancer and cancers of haematopoietic system. B7-L polypeptide pethagonic mice overexpressing testicular cancer and cancers of haematopoietic system. B7-L polypeptide pethagonic mice and cancers and cancers of haematopoietic system. B7-L polypeptide callograft transplantation, graft versus host disease, T-cell dependent B7-L molecules are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; B7-like protein; B7-L; antiinfertility; gynaecological; antirheumatic; antitumour; cytostatic; immunosuppressive; antiarthritic; antirheumatic; antiinflammatory; dermatological; antiporiatic; neuroprotective; antidiabelic; haemosteitic; antithyroid; antiulcer; antiallergic; antiasthmatic; nephrotropic; antibacterial; virucide; tumour; cancer; reproductive disorder; graft versus hoet disease; autoimmune disease; toxic shock syndrome; allergy; nephropathy; skin disorder; endocrinopathy; lymphoproliferative disorder.

immune cell dysfunction or to treat autoimmune diseases such as systemic lupus erythematosus, rheumatoid arthritis, multiple sclerosis, diabetes, immune thrombocytopenic purpura and psoriasis, chronic inflammatory disease such as inflammatory bowel disease (Crohn's disease and ulcerative colitis), Grave's disease, Hashimoto's thyroiditis and disease such as inflammatory beful as immunosuppressive agents for bone marrow and organ transplantation or to prolong graft survival. B7-L molecules are also useful for diagnosis and treatment of diseases involving abnormal cell proliferation, including arteriosclerosis and vascular restenosis. Antagonists of B7-L polypeptides are useful for alleviation of toxic shock syndrome or allosensitisation due to blood transfusions, and for treatment of allergy, asthma and hypersensitivity reactions, nephropathies (e.g. glomeniopathies (Grave's disease), various pneumopathies (extrinsic alveolitis), vasculopathies, coelaac disease, chammopathies (extrinsic alveolitis), vasculopathies and wasthenia gravis, and lymphoproliferative disorders such as multiple myeloma. The present sequence represents the amino acid sequence of human B7-L_h2
      alleviating the symptoms associated with diseases involving chronic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used

in diagnostics as expressed sequence tags for identifying expressed

genes. (I) is useful in gene therapy techniques to restore normal
activity of (II) or to treat disease states involving (II). (II) is
cativity of (II) or to treat disease states involving (II). (II) is
useful for generating antibodies against it, detecting or quantitating a
polypeptide in tissue, as molecular weight markers and as a food
supplement. (II) and its binding partners are useful in medical imaging
of sites expressing (II). (I) and (II) are useful in medical imaging
of sites expressing (II). (I) and (II) are useful for treating disorders
involving aberrant protein expression or biological activity. The
polypeptide and polymucleotide sequences have applications in
diagnostics, forenises, gene mapping, identification of mutations
responsible for genetic disorders or other traits to assess biodiversity
and to produce other types of data and products dependent on DNA and
amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic
amino acid sequences of the invention. Note: The sequence data for this
pattent did not appear in the printed specification, but was obtained in
electronic format directly from WIPO at
the print of the print

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          seminal vesicle hyperplasia in transgenic mice overexpressing B7-L polypeptide. Hence modulators of (1) are useful for the treatment of cancer including seminal vesicle cancer, lung, brain, breast, ovarian, testicular cancer and cancers of haematopoletic system. B7-L polypeptide plathway can be manipulated to regulate cytotoxic T-lymphocyte response in allograft transplantation, graft versus host disease, T-cell dependent B-cell mediated diseases and autoimmune diseases. B7-L molecules are useful for alleviating the symptoms associated with diseases involving chronic

The polypeptide, polynuclectide encoding it and antibody against (I) are useful for treating B7-like polypeptide-related disease, disorders or conditions including reproductive disorders (e.g. infertility, miscarriage, preterm labour and delivery and endometriosis) and proliferative disorders. Antibodies, soluble proteins comprising extracellular domains and other regulators of B7-L polypeptides are useful for enhancing the immune response to tumours. (I) plays a role in growth and maintenance of cancer cells based on the observation of

ulcerative colitis), Grave's disease, Hashimoto's thyroiditis and
diabetes mellitus. They are also useful as immunosuppressive agents for
bone marrow and organ transplantation or to prolong graft survival. B7-L
molecules are also useful for disagnosis and treatment of diseases
involving abnormal cell proliferation, including arteriosclerosis and
vascular resensais. Antagonists of B7-L polypeptides are useful for
alleviation of toxic shock syndrome or allosensitisation due to blood
transfusions, and for treatment of allergy, asthma and hypersensitivity
reactions, nephropathies (e.g. glomerulonephritis), skin disorders
(pemphigus and pemphigoid), endocrinopathies (Grave's disease), various
pneumopathies (extrinsic alveolitis), vasculopathies, coelisc disease,
anaemia, thromboryropenias, duillain-Barre syndrome and myasathenia
gravis, and lymphoproliferative disorders
present sequence represents the amino acid sequence of human B7-L-h4

The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon mincroarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells.
                                                                           Peptide #7113 encoded by probe for measuring cervical gene expression.

Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to single exon nucleic acid probes (SENP: see AAI3115-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide #9881 encoded by probe for measuring placental gene expression
                                       Human; foetal liver; gene expression; single exon nucleic acid probe.
Peptide #9548 encoded by human foetal liver single exon probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 27; SEQ ID NO 34677; 639pp + Sequence Listing; English

                                                                                                                                                     measuring human gene expression in a sample derived from human heart (see ABA1305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

```
The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                              Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human bone marrow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, brain expressed exon, gene expression analysis, probe, microarray,

for analyzing probes useful nucleic acid expression in human adult liver exon Human genome-derived single gene

27; SEQ ID NO 36121; 658pp; English. Claim

The invention relates to a single exon nucleic acid probe (SEND) (1) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their

Compression of the table of probes and creating liames with setting the novel set of probes and compression in a sample derived from human lung, measuring the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung measuring the label detectably bound to each probe of the array; identifying exons in a ewkaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the ewkaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single exon comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon.

Comprising (a) identifying exons from genomic sequence by the method above mentioned microarray; assigning exons to a single exon.

Comprising (a) identifying exons in the tissues and/or cell types using hybridisation to a single exon.

Comprising of the exons in the tissues and/or cell types indicates that the expression of the exons should be assigned to a single exon.

Comprising the exons in the tissues and/or cell types indicates that the expression of the exons should be assigned to a single exon.

Comprise, and for identifying exons in gene in the coded by the probes/open reading frames (ORF). The probes are used for gene expression of the study is an expression of the st dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary complements or the 12387 open reading frames derived from the 12614

                                    Gaudernack G,
  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                  Disclosure; SEQ ID NO 22578; 21pp + Sequence Listing; English.

Feptides AAY65684-Y66142 are fragments of mutant proteins arising from a crameshift mutation in a gene from a cancer cell. The peptides are characterised in that they: (i) are at least 8 amino acids long and a fragment of a mutant protein arising from a frameshift mutation in a gene of a cancer cell; (ii) consist of at least one amino acid of the mutant of a protein sequence encoded by the gene; (iii) comprise 0-10 amino acid from the carboxyl terminus of the normal part of the protein cardinate to the arxboxyl terminus of the mutant sequence and may cardinate extend to the carboxyl terminus of the mutant part of the protein as determined by a new stop codon generated by the frameshift mutation; and (iv) induce, either in their full lengths or after processing by an artigen presenting cell (APC). T cell responses The genes that the peptides are derived from, are characterised as susceptible to frameshift mutation by having a mono nucleoside base repeat sequence of at least 5 cellecion of 1 or 2 nucleoside base residues from the repeat sequence. The nucleoside base residues from the repeat sequence. The collection of 1 or 2 nucleoside base residues from the repeat sequence. The novel peptides can elicit T cell responses and toxicity against tumours and cancer cells carrying genes with frameshift mutations. The novel peptides and DNA sequences can be used for the preparation of a composition for the treatment or prophylaxis of cancer
                                                                                                                                                                                                                    New peptides derived from genes with frameshift mutations, used to develop products for the treatment and prophylaxis of cancers.

peptides derived from genes with frameshift mutations, used to develop products for the treatment and prophylaxis of cancers.

Claim 13; Page 29; 166pp; English.

frameshift mutation in a gene from a cancer cell. The peptides are frameshift mutation in a gene from a cancer cell. The peptides are characterised in that they: (i,) are at least 8 amino acids long and a fragment of a mutant protein arising from a frameshift mutation in a gene fragment of a protein sequence encoded by the gene, (iii) comprise 0-10 amino acid from the carboxyl terminus of the normal part of the protein caid from the carboxyl terminus of the mutant sequence and may further extend to the carboxyl terminus of the mutant sequence and may as determined by a new stop codon generated by the frameshift mutation; as determined by a new stop codon generated by the frameshift mutation; and (iv) induce, either in their full lengths or after processing by an autigen presenting cell (APC). T cell responses The genes that the peptides are derived from, are characterised as susceptible to frameshift mutation by having a mono nucleoside base repeat sequence of at least 5 residues, or a di-nucleoside base repeat sequence of at least 5 reclades, or a di-nucleoside base residues from the repeat sequence. The concelesion of 1 or 2 nucleoside base residues from the repeat sequence. The novel peptides can elicit T cell responses and toxicity against tumours and canneer cells carrying genes with frameshift mutations. The novel composition for the treatment or prophylaxis of cancer

                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                     capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABR72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                    The invention relates to an isolated nucleic acid detection reagent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therepeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL161840-ABL16175) and the encoded proteins (ABBS7737-ABR2072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

```
New polynucleotide comprising a plant nucleotide sequence having an open reading frame that encodes a polypeptide associated with disease resistance, useful for conferring resistance or tolerance to a plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel isolated polynucleotide comprising a plant nucleotide sequence having an open reading frame that encodes a polypeptide associated with disease resistance or its fragment having substantially the same activity as the full-length polypeptide. The polynucleotide of the invention is useful for conferring resistance or tolerance to a plant pathogen. The present sequence represents a protein conferring disease resistance used in the invention.
                                                                                                                                                                                                           disease resistance; pathogen tolerance; plant pathogen; plant; rice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Goff SA, Moughamer T;

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a producter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of agene in an operon required for proliferation, or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological contains a gene product or that has an activity against a biological pathway required for proliferation. Capathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound sactivity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of proliferation of an organism. The antisense nucleic acids are useful for dencity discourse proliferation of solate candidate molecules for rational and dencinal 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this of patent did not form part of the printed specification, but was obtained in electronic format directly from Mush from Mush of the printed specification, but was obtained ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length:

                             New Acinetobacter baumanii proteins and nucleic acids, useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or as biocontrol agents for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for baumannii protein.
                                                                                                                                                                                                       baumannii; bacterial disease; antibacterial; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   200000

The protein sequence given has transglutaminase (BTG) activity. The DNA encoding this protein has a base sequence which can be used suitably in an expression system using E. coli or yeast as a host. The base sequence can be compared to those given in AAQ24197 and AAQ24200 which are derived from Actinomycetes sp. BTG catalyses an acyl rearrangement reaction of a gamma-carboxyamide gp. of glutamine. It introduces intra- or intermolecular formation of epsilon-(gamma-Gln)-Lys cross-linking when an epsilon-amino gp. of a Lys residue acts as an acyl receptor. When water casidues to Glu residues by deamination. The enzyme is used in the prodn. Of thermally stable materials such as also used in the prodn. of thermally stable materials such as microcapsules and carriers of immobilized enzymes. The DNA sequence given allows the prodn. of BTG efficiently and in large quantity. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DNA fragment encoding trans:glutaminase - is inserted into vector, e.g. PnJ1053-BTG, for protein expression.

Bacterial transglutaminase polypeptides useful for polymerizing proteins, e.g. to modify the properties of food, pharmaceutical or cosmetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel bacterial transglutaminase polypeptide. (I) can be used, e.g. in the food, pharmaceutical and cosmetic industries, to polymerize proteinaceous materials in order to improve their properties, e.g. texture, gel strength, breaking strength, viscosity, elasticity or taste. (I) can also be used to immobilize enzymes and antibodies. This sequence represents a transglutaminase protein fragment isolated from Streptoverticillium mobaraense. (Updated on 17-OCT-2003 to standardise OS field)
                                                                             Transglutaminase; food industry; pharmaceutical industry; texture; cosmetic industry; proteinaceous material; gel strength; viscosity; breaking strength; elasticity; taste.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Transglutaminase, food industry, pharmaceutical industry, texture, cosmetic industry, proteinaceous material, gel strength; viscosity; breaking strength, elasticity, taste.
                                                  Streptoverticillium mobaraense transglutaminase protein fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Streptoverticillium S-8112 transglutaminase protein fragment
                                                                                                                                                                                                                                                                                                         Otterbach J,

Bacterial transglutaminase polypeptides useful for polymerizing proteins, e.g. to modify the properties of food, pharmaceutical or cosmetic
                                                                                                                                                                                                                                                                                              This invention describes a novel bacterial transglutaminase polypeptide.

(I) can be used, e.g. in the food, pharmaceutical and cosmetic industries, to polymerize proteinaceous materials in order to improve their properties, e.g. texture, gel strength, breaking strength, viscosity, elasticity or taste. (I) can also be used to immobilize enzymes and antibodies. This sequence represents a transglutaminase isolated from Streptoverticillium S-8112. (Updated on 17-OCT-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Transglutaminase; microbial; gelled food; jelly; yogurt; cheese;
cosmetic; meat quality; microcapsule production; high thermal stability;
carrier; immobilised enzyme.

The present sequence represents a transglutaminase of Streptoverticillium sp. . The specification describes a new microbial transglutaminase that has the N-terminal aspartic acid of the present transglutaminase deleted. Bliminating the N-terminal App from microbial transglutaminase allows efficient removal of the terminal Methionine residue added when the protein is expressed in Escheritchia coli. The E. coli methionine aminopeptidase acts well on Met-Ser but only poorly on Met-Asp, so problems of antigenicity associated with Met-terminated proteins are avoided. Recombinant transglutaminase is used to produce galled foods (jellies, yogurt and cheeses) or cosmetics, to improve the quality of meat, in the production of materials for microcapsules of high thermal stability and as a carrier for immobilised enzymes. This invention relates to a process for the production of a foreign secretory protein through the construction of a recombinant coryneform bacterium. The coryneform bacterium is transformed with an expression construct in which DNA encoding a target foreign protein pro-structure is ligated to the downstream region of DNA encoding the signal peptide domain of a coryneform bacterial protein. Following transformation with the expressed protein is cultured, and the pro-peptide cleaved from the expressed protein. Transgultaminases produced using this process are useful in the food processing and pharmaccutical industries. The present sequence represents a transglutaminase related protein, which can be used in the method of the invention. (Updated on 11-SEP-2003 to standardise OS field)
            Efficient secretory production of foreign proteins e.g. transglutaminase employing transformant coryneform bacterium, simply on industrial scale with direct recovery for use in food processing and pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Microbial, transglutaminase, protein co-ordinate data; stereo-structure;
